

MySQL

As a MySQL partner we have in-depth knowledge about MySQL and more specifically MySQL and the InnoDB storage engine.

Schema design Using our vast experience we feel very confident in designing normalized database schemas with necessary optimizations in order to reach best possible performance in very practical scenarios.

Â

Replication

MySQL replication is something that we are comfortable in setting up and using.

To overcome some of the short-comings in MySQL native replication we have also developed a separate utility for replication of multiple masters to a single slave, making it possible to map one MySQL database in the master to another database on the slave.
